ABSTRACT

The landslide is one kind of serious hazards that cause substantial life and financial losses. In order to manage and reduce its damages, many efforts to monitor and alert landslides are studied and developed.

The project mainly aims at studying the geotechnical aspects of a landslide occurred in this region. The study includes the primary investigations of the site, collection of soil samples, testing of samples and analysis of test results with scientific theories, mapping of the study area and finally proposing the remedial measures to mitigate landslide effect.
